About Emerald www.emeraldinsight.com

Emerald is a global publisher linking research and practice to the benefit of society. The company manages a portfolio of more than 290 journals and over 2,350 books and book series volumes, as well as providing an extensive range of online products and additional customer resources and services.

Emerald is both COUNTER 4 and TRANSFER compliant. The organization is a partner of the Committee on Publication Ethics (COPE) and also works with Portico and the LOCKSS initiative for digital archive preservation.

How Brazilians shop? An investigation of Brazilians' consumer values, lifestyles and mindset.

Abstract

Purpose – This paper discusses the role of Brazilian consumers' personal behavioral values, lifestyle and mindsets in relation to purchase decisions.

Design/methodology/approach – The study employed empirical research through a survey of 1,508 consumers to establish a typology.

Findings – Drawing on typologies in the literature, the study found that some dimensions should be combined to create certain particular ideal types of Brazilian consumers. Specifically, the study identified four different types of Brazilian consumer, each of which has its own way of making purchase decisions. Although there are small differences from a lifestyle perspective, there are distinctions between the groups in terms of consumer preferences and personal behavioral values.

Research implications – Based on the results, the paper proposes a model to understand and classify consumer behavior in the Brazilian context based on the four traits.

Practical implications – The findings suggest a number of strategic measures for organization, brands, and marketing practitioners.

Originality/value – The research employs recognized frameworks to develop a new typology of ideal types of consumers specific to the Brazilian context, but using a methodology that can be applied more broadly.

Keywords Brazilian consumers, Consumer values, Lifestyle, Consumers' mindset

Introduction

Research context

It is possible to investigate human society from different perspectives. In the social sciences, there is strong interest in scrutinizing topics relevant to people, including how they make decisions and behave. However, different national cultures seem to have their own particularities. This paper aims to investigate the factors underlying Brazilian consumers' purchase decisions.

Brazil is a developing country and it is the most influential country in South America. It is one of the rising economic powers in the BRICS group of countries¹ with a gross domestic product (GDP) of USD 2.3 trillion and a population of 200,000 million. Brazil is also one of the world's biggest democracies. The Brazilian economy is based on agriculture (soya), petrol and mining activity (iron). Brazil is also known for its natural resources, mainly due to the Amazon rainforest, a vital regulator of the climate and a very important reservoir of plants and animal life.

Although it is a rich country, there is a wide gap between rich and poor. Social differences are not exclusively due to economic aspects. Brazil has been colonized by many different countries with different purposes. It was officially a Portuguese colony, but many other nationalities have lived in and exerted considerable influence over different locations. These include the Germans and Italians in the south, Africans in the northeast, the Portuguese and Italians in the city of São Paulo (the economic heart of Brazil), the French in Rio de Janeiro (the center of tourism), and the Dutch in Recife (one of the biggest Brazilian cities).

Brazil is a very rich and large country comprising many different cultures, making Brazilian people very different from one location to another, and with wide social gaps between them. These differences are also evident in Brazilians' consumer behavior. Brazil

¹ The group comprises Brazil, Russia, India, China, and South Africa.

was under a dictatorial government from 1964 to 1984 and it experienced a very turbulent period of hyperinflation from 1984 to 1994. There was considerable economic growth from 1994–2010, since when there has been a deep depression. Each age group has a particular way of shopping due to its economic experience. Therefore, understanding Brazilian consumer behavior is a difficult but necessary task.

Over a considerable period, social scientists have focused on the characterization of behavior in relation to decisions. Indeed, examining behavior is the basis for the study of organizations, from which it is apparent that people exhibit socio-organizational-group behavior. With this field, a particular segment that is still promising for research concerns understanding how people react to known situations, based, for example, on their attitudes. People show their attitudes towards various entities on a daily basis, and hence it is of interest for those involved in marketing to investigate the evidence of behavior in terms of the exchange between people, brands, and companies.

From this perspective, it is important to define attitude as a predisposition, relatively stable and organized, to respond in the form of opinions (verbally) or actions (behaviorally), in the presence of objects (people, ideas, events, things) in a particular way (Bardin, 2009). Thus, an attitude represents a consistent mental position, manifested in relation to something or someone (Ander-Egg, 1978). Attitudes are the visible interface of a complex phenomenon, namely a voluntary expression constrained by individual psychological conceptions termed behavioral values. Values are ideas or beliefs pertaining to goals or behaviors that transcend specific situations (Rokeach, 1973), the study of can provide insights in terms of understanding and predicting decision-making behavior. People pursue goals and behaviors not just in their buying patterns, but also in their lives. These are expressions of their most basic values, which can be known and prioritized (Schwartz, 2006). Therefore, understanding these values may present a way of making people's lives better by enabling them to attain their goals with greater ease. From the perspective of marketing, the interest in obtaining such knowledge lies in the ability to predict attitudes and make management decisions.

The understanding of values requires knowledge of the context in which they are embedded, as environmental and cultural conditions determine their relative importance, evidenced in their greater or less relevance. However, concepts of space are changing constantly under the influence of globalization. Among the main effects of globalization is the phenomenon of deterritorialization, which calls the concept of community into question and suggests that cultural representations are no longer bound to countries or territories (Wenjing, 2005). Deterritorialization, in turn, results in fragmented cultural distribution around the globe, placing different cultures side by side—sometimes cultures that are essentially incompatible—reflecting a wide variety of products, lifestyles and experiences that represent different cultural identities (Firat, 1997).

In response to this context of fragmented cultures, consumers create new ways of finding their roots in an attempt to regain their lost identity in a process called reterritorialization (de Kale, 2013). Prior research has suggested that many consumers prefer domestic to foreign products, even when the quality is lower and the price is higher (Siamagka and Balabanis, 2015). This phenomenon is observable, for example, in colonies of Brazilians who, although living abroad, try to maintain their identity by consuming Brazilian foods, spices, music and movies. This, then, provides evidence that there are still cultural differences between people of different territories, even when in close proximity geographically.

With this evidence, we believe that the study of behavioral values as a basic form of attitude should not only consider but also restrict itself to the cultural environment as a way of identifying and exploring in depth the characteristics of this population. These characteristics can then be highlighted in making a contrast with those of other cultures. Generally, it is

assumed that values are ubiquitous across cultures, but their relative importance varies according to the individual aspects of each territory (Bruns *et al.*, 2004).

It is in this current context of the reconfirmation of national culture that the proposal for this work arises, namely to investigate the values of Brazilian consumers and build a typology in response to the research question: What are the salient characteristics (values, consumer preferences, mindsets, lifestyles) of Brazilian consumers? In building this typology, the study takes as its basis the proposition that each person has a specific set of values that determine how he or she behaves, and that the greater the similarity between the values of people the more similar will their behavior be. In contrast, those with different sets of values will behave in different ways. Therefore, values are an important attribute on which to base the typology.

The reasons underpinning consumers' choices are a very interesting field for marketing management professionals and there is still a lack of empirically based studies appraising their component facets (Graffigna and Gambetti, 2015). Moreover, Brazilian companies have an interest in understanding how to implement different market strategies for different subcultures. Unfortunately, there is to date no standard tool to measure the parameters of such typologies. In particular, there is a lack of literature measuring and identifying the parameters of subcultures among Brazilian customers. Thus, the objective of this research is to identify and classify types of Brazilian consumers based on their characteristics.

The Brazilian consumer

Brazilian people are unique in terms of their context. The only country in South America to have been colonized by the Portuguese, Brazil is marked by miscegenation, and cultural and religious tolerance, but also social inequality. Moreover, according to Rezende (2008) Brazilians have a unique personality, being warm and establishing friendships easily. Brazil is an ethnographically diverse country, formed by the mixing of whites, blacks and Indians, who have their origins in countries such as Portugal, Italy, Arab countries, Japan, the Ivory Coast, and Angola, as well as the indigenous population predating the Portuguese colonization. Each of these groups brought with them different ways of trading with their own quirks and rules (Freyre, 1985).

At the time of its discovery, Brazil was inhabited by various tribes that, with the exception of the Tupi people, lived independently. There was no organization among the groups, yet they predominantly lived in a state of peace with each other, albeit with some border conflicts. This changed radically with the arrival of the Europeans. Whereas the Indian populations comprised autonomous tribes, autarchic, and not stratified into classes, the settlers lived in an urban civilization in a class society, with power centralized in Lisbon and the Overseas Regency Council. The Portuguese being Catholic, it is necessary also to highlight the strong influence of the Vatican and the Catholic Church at the time, which pertained not only to the colonization of Brazil, but also to the Spanish colonization of other parts of South America. The Europeans' encounter with the Old World destroyed the foundations of indigenous social life, with the tribes denied their values and enslaved. Some indigenous peoples fled to the interior of Brazil, but they took with them diseases brought by the Portuguese, which culminated in the decimation of the native populations.

The first acts of Brazilian colonization were to adapt Brazilian urban centers to equate them with European cities and thus participate in the world market (Ribeiro, 1995). Among the main commercial changes were the incorporation of Portuguese and European technology in the production of bricks, shoes, soap, rum, car wheels, bridges, and boats, the rise of transoceanic shipping, the establishment of cane mills, the introduction of livestock, the adoption and diffusion of new species of cultivated plants, the social restructuring of urban and rural centers, the introduction of slavery, and the provision of funding for new businesses. In addition, the country experienced the introduction of the Portuguese language, the presence

of only a tiny social stratum of scholars, and the positioning of the Catholic Church as the official church, and obedient European-style national artists. All of these changes came at a cost.

Barbosa (1992) proposed that one of the main Brazilian characteristics is *jeitinho Brasileiro*, which denotes a group of special ways of solving tough problems, draws predominantly on creativity, and sometimes includes illegal practices. Rezende (2008) argued that, quite apart from *jeitinho Brasileiro*, Brazilianness connotes a very emotive and easygoing people.

Thus, the high miscegenation, accelerated colonization, and the need for interaction between societies that are very different has made Brazil a country with unique characteristics, differing even from bordering nations in South America. This provides a unique basis for Brazilian consumer behavior, leading to the development of this research.

The rest of this article takes the following structure: The next section comprises a literature review, developing the conceptualization of values in the context of consumer behavior, and then presenting the theoretical foundations for defining lifestyle, and finally contextualizing the concepts in relation to studies concerning the Brazilian people and their implications for the behavior of Brazilian consumers. The following section addresses the methodology for the empirical research. There is then a section presenting the results of the data analysis, and finally the proposal of the typology categorizing the four types of typical Brazilian consumer, prior to the conclusion and discussion of limitations.

Literature review

Consumer values

The term “value”, prior to its own application in consumer studies, was initially proposed as a means of breaking away from the economic concept, before being adopted by the fields of psychology and sociology, and providing the basis for contemporary studies about the consumer (Kyrk, 1923). However, little is yet known about how cultural values affect marketing tools and consumers’ responses to them (Thompson and Chmura, 2015).

Values can be defined as abstract concepts or representative beliefs concerning objective goals or desired end states (Rokeach, 1973). The term value is multidisciplinary in nature and may relate to a number of concepts. For example, in anthropology it refers to social elements imposed on the individual and causing a reaction, in sociology it concerns aspects that develop cohesion among groups in society, and in psychology it relates to the basis for actions and individual judgments concerning the achievement of goals. Regardless of its application, the meaning given to the term “value” ultimately characterizes it as the most abstract level of cognition that can influence the perception and evaluation of objects, situations, and relationships (Schwartz, 2006); thus, values are used as criteria by individuals and groups to guide the evaluation of stimuli such as situations, people, and objects.

From the perspective of consumer behavior, values became the object of study when understood to form the beliefs that individuals have about their lifestyles and acceptable social behaviors (Blackwell *et al.*, 2006), in particular as they play a central role in the constitution of an individual’s personality (Burgess, 1992). Due to their psychological nature, it is not possible to measure values directly, thus leaving researchers to observe the attitudes of people in a structured way to infer the values they hold. The primary scale for measuring personal values was proposed by Rokeach (1973), who argued that they can be grouped into two categories, one that relates to ends (terminal values) and the other to means (instrumental values). Specifically, while the former category suggests that values relate to motivational factors of a personal, social, and mixed (universal) order, the second focuses on the hierarchy of individual needs as the basis for its scale. With the passage of time and advances in academic debates, the original Rokeach scale gained some enhancements, as applied in

Brazil by Tamayo and Schwartz (1993) and resulting in new measurement instruments, such as that of Schwartz (2006). In addition, marketing researchers, such as González *et al.* (2015), have employed value-based typologies, and have suggested that marketing managers and policymakers should consider different combinations of ecological behaviors, as well as including demographic and attitudinal variables, such as perceived consumer effectiveness and environmental and social values, rather than only focusing on high or low adoption levels of pro-environmental behaviors in general.

Therefore, this study adopted the Schwartz (2006) scale as an instrument for measuring values. The instrument in question draws on the theoretical contributions of Schwartz (1992), and Tamayo and Schwartz (1993), revising the model of universal dimensions proposed by Rockeach (1973). After developing the theoretical proposition, empirical tests were performed that demonstrated the robustness and validity of the proposed model. The model deploys 10 universal values that are both complementary and opposing according to the dynamics shown in Figure 1.

[Insert Figure 1 about here]

The model presented in Figure 1 defines compatibilities and conflicts among 10 proposed value types originally proposed by Schwartz (1992). Their motivational concerns are as follows:

- Universalism (UN): understanding, appreciation, tolerance, and protection of the welfare of all people and of nature.
- Benevolence (BE): preservation and enhancement of the welfare of people with whom one is in frequent personal contact.
- Conformity (CO): restraint of actions, inclinations, and impulses likely to upset or harm others and violate social expectations or norms.
- Tradition (TR): respect, commitment, and acceptance of the customs and ideas that the traditional culture or religion provides for the individual.
- Security (SE): safety, harmony, and stability of society, of relationships, and of the individual.
- Power (PO): social status and prestige, control or dominance over people and resources.
- Achievement (AC): personal success through demonstrating competence according to social standards.
- Hedonism (HE): pleasure and sensuous gratification for oneself.
- Stimulation (ST): excitement, novelty, and challenge in life.
- Self-direction (SD): independent thought and choice of action, creation, and exploration.

The value types are grouped into two orthogonal higher-order dimensions. A decade after the original proposition, Schwartz (2006) updated the model (see Figure 2), contending that those values located close to each other are also likely to operate jointly as guiding principles in individuals' lives, whilst opposing values are either in conflict or complementary. Moreover, Schwartz (2006) labeled the diagonal axes personal vs. social and protection vs. growth.

[Insert Figure 2 about here]

In addition, Figure 3 relates the universal values to the lifestyle of consumers, another variable of interest in this study. It is recognized that there is an interdependent relationship

between these variables as values form part of consumers' lifestyle. For clearer differentiation of the constructs, lifestyle is here treated as the actions of consumers and how they make use of their time and money.

[Insert Figure 3 about here]

There are additional perspectives on consumer values. Won-moo *et al.* (2015) view consumer values as based on consumers' demographic profiles. According to them, consumer values relate mainly to consumer satisfaction rather than to shopping behavior. Reinforcing this point of view, Mattison Thompson and Chmura (2015) link consumer values to loyalty programs. In both cases, the authors view values as more of a compartmental issue than psychological. Their views draw on the cultural perspective of Hofstede (2015), which considers that cross-cultural issues and social implications are strong enough to mold people's values and behaviors.

Schwartz (2006), however, defines values as beliefs, thereby adopting a deeper perspective that may allow understanding of consumers' behavior before the observation of the behavior itself. Whilst the cultural and social perspectives are important, but the beliefs perspective is essentially deeper and this is the reason it refers to universal values.

In addition, Tamayo and Schwartz (1993) and Tamayo (2007) studied behavior unique to Brazilians from a psychological perspective, just as in Schwartz (2006). These studies suggest that the universal personal values of Schwartz (2006) are appropriate for analyzing the Brazilian context. The results show that there are different values for each subgroup.

Lifestyles and consumer behavior

The term lifestyle, in the meaning intended by this study, refers to an individual's response to the conditions in the environment, for example, market growth, the division and specialization of labor, and urban differences, which allow subjects to adopt or create their own styles. Thus, lifestyle is understood as a protection from or resistance against the trends of society (Simmel, 2011).

Lifestyles are formed by the daily choices that individuals make based on their personal values. However, such choices are influenced by exogenous factors, such as consumption and the pursuit of professional recognition (Weber, 1958). Thus, the construction of lifestyle is the product of the external environment, reinforcing the worth of the objective of this research to investigate the particularities of the phenomenon among Brazilians, because different social conditions correspond to different lifestyles (Bourdieu, 2003).

From the perspective of consumer behavior, a lifestyle is a pattern besides the motivations for the types of goods and services that people consume, and is therefore identifiable through observation of daily practices, such as housing, food, clothing, appearance, hours of work, leisure, religion, organization of space and time, and socializing with other social agents. Bolton *et al.* (2015) and Goddard and Morrow (2015) suggested that lifestyle can determine consumer behavior. Thus, lifestyle can be defined as the choices that consumers make through the range of stimuli and opportunities offered to them (Giddens, 1992), and thus can be observed and measured.

The classic method of measuring lifestyle is guided by symbolic activities and class indicators or social position. Variables such as the size of one's house (apartment), the value of one's car, or characteristics of one's neighborhood can be used to define the group to which an individual should be classified (Bearden and Woodside, 1971). Moreover, several authors (e.g. Santos and Fernandes, 2010 and Giraldi and Ikeda, 2010) have proposed typologies providing a classification of lifestyles based on a hierarchy of preferences for products in

making purchase decisions. Table 1 presents a summary of some work in this area and the propositions for investigating lifestyle.

[Insert Table 1 about here]

Of the above propositions, that adopted for this research was the classification proposed by Blankson and Kalafatis (2004) as this scale covers the main dimensions addressed in the literature, and has been proposed, tested, and validated by empirical studies. In line with this proposal, it is necessary to contextualize individuals' environment so that the observations have significance and the typological propositions are relativized. Therefore, following a discussion of the role of consumers' mindsets, the next section briefly discusses the Brazilian people and presents the scenario in which the survey was conducted.

Consumers' mindsets

Considering the mindset of a consumer is extremely important in developing an understanding of the process of decision making and purchasing, in which a tension exists regarding the prevalence of logical thinking and creative thinking. Logical thinking is the opposite of creative thinking. Consumers who think creatively follow no set of predetermined rules and use intuition, based on certain beliefs, as a tool for decision making (Lucian *et al.*, 2008). Moreau and Engeset (2016) argue that creative and logical thinking are strongly related to social practices. According to them, creative thinking is losing ground to logical thinking because people are facing fewer opportunities to engage in creative thought as they are increasingly solving well-defined problems.

Researching mindsets to understand consumer behavior is a new approach, but it has been receiving increasing attention. For example, Chang and Cheng's (2015) study suggests that a utilitarian orientation and an individualistic mindset are positively related to skepticism toward advertising, while a hedonic orientation and a collectivistic mindset are negatively related to skepticism toward advertising. The various types of thinking are represented by models of cognitive maps, which are representations in the minds of people of how the world works, and these maps are often formed through education, experience, and interaction with others. This is highly complex and Caldwell (2015) contends that traditional choice-based conjoint methods for researching mindsets are based on an unrealistically rational model of consumer decision making. The concept of cognition is related to how people acquire, store, and use knowledge (Lucian *et al.*, 2008). Thus, cognitive mapping has some important implications. First, it suggests that decision makers do not operate directly in the realm of objective facts, but within a cognitive reality, i.e., a creation of reality.

There are two models of cognitive functions: an intuitive mode, in which judgments and decisions are taken automatically and quickly, and a logical model, which is deliberate and slower. Thus, Kahneman (2003) considers that decisions are taken based on two systems, one intuitive and the other rational. Table 2 presents the scheme of these models.

[Insert Table 2 about here]

Consumers who make decisions intuitively do so at greater speed and have less need for information during the purchasing process than those who take decisions logically, a fact that significantly alters the way in which a company should communicate.

In terms of research design, Lucian *et al.* (2008) and Moreau and Engeset (2016) agree that creative and logical thinking are opposite sides of same dimension and can be observed, but the research approaches differ. Moreau and Engeset (2016) measured creative thinking through an experimental design, whereas Lucian *et al.* (2008) developed a scale and adopted a

survey approach. In line with Lucian *et al.*'s (2008) methodological design, Pfeifer *et al.* (2016) also conducted a survey to measure the entrepreneurial mindset in Croatia, developing a construct and scale specifically for this purpose. The scale proposition is more appropriate in this research because it fits the methodological propose. The scale adopted for this research is the one proposed by Lucian *et al.* (2008), tested, adapted, and later validated through empirical research (Lucian *et al.*, 2009). This instrument has the property of capturing the tendency of the person and rational thinking or intuition.

Although the theories presented here are universal, as are the measurement instruments, this research concerns a specific context and is limited to the study of Brazilian consumers as this context may prove to be unique.

Background on Brazilian consumers

There are some previous studies and typologies concerning Brazilian consumers' preferences. Santos and Fernandes (2010) proposed a typology for Brazilians' responses to dissatisfaction, negative word-of-mouth, and switching behavior. They discovered that there are four profiles of client groups: irate, passive, disloyal, and compromised. Brazilians are more inclined to adopt a negative attitude than a positive attitude toward brands.

Some consumer preference studies in Brazil have applied models developed in other international contexts. For example, Ferreira *et al.* (2012) applied Geuens *et al.*'s (2004) instrument to create a typology of airport consumers' behavior. The results revealed four dimensions of buyer motivation: two concerned the characteristics of an airport, i.e., the "atmospheric" and "airport-related" dimensions, and two related to traditional buying behavior, i.e., the "social" and "functional" dimensions. Based on these, the study classified Brazilian passengers in four different groups: interactive consumer, self-centered consumer, traditional consumer, and apathetic/indifferent consumer. Such typologies based on international instruments are widely accepted in the literature, but they tend to neglect too many local aspects, although Ferreira *et al.* (2012) argue that a global approach is better than a local approach for understanding tourism behavior.

Santos and Fernandes (2010) opted to adopt a social approach to the study of consumer behavior, whereas Giraldi and Ikeda (2010) employed values as the basis for their typology. They proposed that personal values can be used to develop strategic segmentation. In addition, Leão *et al.* (2011) believe that values provide a more adequate basis for a consumer typology than other approaches. They identified human values and consumption aspects indicative of the wine culture in Brazil, developing a typology of wine consumers' profiles to present the relationship between values and consumption. They found three categories of consumer: the first is based on hedonism, the second on social interactions, and the third on adventure. Leão *et al.*'s (2011) typology focuses too intently on wine consumers to support this research, but it demonstrates that values can form a valid basis for classifying consumers. Leão *et al.* (2011) drew on Rokeach's (1973) study of values. This is a classic reference that provided the basis for Schwartz's (2006), and Giraldi and Ikeda's (2010) works, as it does for this research.

Research methodology

This research has its foundations in the previous studies of Schwartz (2006), Blankson and Kalafatis (2004), and Lucian *et al.* (2008), and in this respect draws on traditional psychometric research methods, using dimensions and measurement scales validated in the literature. The methodology is descriptive in nature and employs data from a survey with 1,508 respondents distributed in 16 Brazilian states. The questionnaire combined the ten universal values of Schwartz (2006), the ten 10 generic consumer preferences based on strategic positioning developed by Blankson and Kalafatis (2004), and the two models of

cognition—rational and emotional—of Lucian *et al.* (2008), as well as questions about lifestyle and the respondents' socio-demographic profiles.

The study collected data using the online service *GoogleForm*[®], which served as the interface for the electronic questionnaire and the database. The population for the study includes all consumers older than 18 years, born and raised in Brazil; in other words, for statistical purposes, it is considered to be infinite. In this situation, and considering 5% an acceptable error margin, as is the practice in social research, the sample size is calculated to be 400 respondents (Oakland, 1953). However, while respecting the law of large numbers, we decided to attain the greatest possible number of respondents because we adopted a snowballing, i.e., non-parametric, approach to data collection. This choice has certain implications in terms of generalizability; however, for the purposes of proposing a typology, it is not necessary to generalize the data, only to evidence that such values exist and can be grouped into a particular observable logic that allows one to call such a product an ideal type.

Measurement of traits

As the research proposed to measure four traits—personal behavioral values, consumer preferences, consumers' mindsets, and lifestyles—to propose a group classification of Brazilian consumers, it was necessary to choose a reliable and valid scale for each of these. The marketing literature has proposed many scales, but this study employs those of Schwartz (2006), Blankson and Kalafatis (2004), and Lucian *et al.* (2008) as they were validated by their original authors and fit perfectly with the research purpose.

The Schwartz value survey (SVS) is one of the most cited scales of human values. The questionnaire used the 51 original items from Schwartz (2006), applying a five-point Likert-type scale (1 = not important at all; 5 = very important). Blankson and Kalafatis' (2004) scale for measuring consumer preferences contains 54 statements to which survey participants responded on a five-point Likert-type scale (1 = not important at all; 5 = very important).

There are certain lifestyle scales, such as those of Grunert *et al.* (2001) and Ahlfeldt *et al.* (2014), but from a consumer perspective, according to Solomon (2010), lifestyle concerns personal choices regarding spending time and money, whereas to Sheth *et al.* (1999) it depends on the social context. Thus, there is no single scale for measuring lifestyle; rather, the various scales tend simply to ask how respondents spend their time and money. In this study, bearing in mind the specific Brazilian research context, the questionnaire asked about free time, giving the following options: outdoor activities, cultural outings, night life, electronic entertainment (e.g., television series, video games, and using computer-mediated social networking platforms), family, gastronomy, intellectual activities, shopping, sports, extreme sports, and religious activities.

Finally, Lucian *et al.*'s (2008) proposition for measuring how consumers take decisions is the only Brazilian native scale used in this study. As Barbosa (1992) and Rezende (2008) note, Brazilians are more emotional than the inhabitants of other countries so a native scale is best suited to measuring their responses. Lucian *et al.*'s (2008) scale contains 18 statements applied on a five-point Likert scale (1 = strongly disagree; 5 = strongly agree). All the items from the three scales are provided in Table A1 in the Appendix.

Analysis

The data analysis took place in two stages. The first contextualized the average profile of the respondents and analyzed the sample's behavior in relation to the mental model of purchase decisions, their prioritization of dimensions in choosing a product, and the hierarchy of values. Following this, the second phase consisted of an analysis of clusters and multiple discriminant analysis (MDA), aimed at identifying how many different profiles could be characterized within the sample. Complementarily, certain statistics measuring central

tendency were calculated to provide a better contextualization of each ideal type in the Brazilian context.

Survey results

Sample characteristics

First, it is necessary to contextualize the sample profile to provide the context of the study participants and the results. The respondents were mostly women (56.8%) with a mean age of 30 years, and an annual income of between 32,500 and 97,500 BRL (59.9%). The respondents were from 16 Brazilian states, but with the greatest concentration in Pernambuco (73%). For the proposition of a typology, such a concentration does not affect the validity of the study because it is an initial effort at developing a national profile, which should further be tested in future studies.

Survey scales

Having identified the respondent profile, the analysis turns to the range of mental models of decision-making, based on Lucian *et al.* (2009). The objective of this analysis is to understand the influence of reason and intuition (emotion) in the decision making of the individual. The scale consisted of 18 items, with agreement to 9 reflecting a tendency toward emotional behavior and agreement to the other 9 a tendency toward rational behavior. Separating out the rational and emotional items, the sum of responses was calculated for each and a latent variable generated with values of between zero and 9, directly proportional to the behavior in question. The latent mental model of the decision-making variable was used for the elaboration of the typology, reported later, but to illustrate its application, Table 3 provides descriptive statistics, from which it can be observed that there is a balance between the extremes with a slight tendency toward emotional decision-making.

[Insert Table 3 about here]

The survey also examined the choice of consumers based on the strategic positioning of the companies' marketing through the Blankson and Kalafatis (2004) scale. Based on the analysis, the hierarchy shown in Table 4 was constructed.

[Insert Table 4 about here]

When considering the full sample, it is apparent that the main dimension valued by customers in product purchasing is related to trust, followed by a sense of value for one's money. These choices reflect the lifestyle of the respondents, namely, how they prioritize their purchase decisions.

To complete the necessary inputs to develop the typology, the survey examined the values of the respondents in relation to Schwartz's (2006) universal values (see Table 5).

[Insert Table 5 about here]

Table 5 shows that the value that is the highest priority for the participant consumers is personal satisfaction, followed by benevolence, and values relating to the achievement of personal goals.

The lifestyle measure asked the sample how they preferred to spend their free time. The survey presented several options (see Table 6), among which around 28% reported they preferred outdoor activities, followed by cultural outings (13.9%), night life (12%), and electronic entertainment (11.3%).

[Insert Table 6 about here]

Thus, after observing the average responses concerning the reported attitudes and behavior of the respondents, it is possible to move to the next step: identifying ideal types in order to develop the typology and address the general objective of this research.

Identifying types of Brazilian consumers

Continuing the analysis, the next step towards the goal of this research is to analyze the data to identify the types of Brazilian consumers based on higher dimensions. The study performed this analysis using *k-means clustering* because this procedure serves to identify homogeneities between groups of cases based on selected characteristics, using algorithms capable of handling large samples. This analysis allows the researcher to use personal judgment in deciding the number of clusters to be formed; thus, a saturation technique was used, namely, when the groups began to show a very similar profile, no further clusters were developed. This study found it possible to derive up to four groups from the sample in question while maintaining a certain difference between their profiles. On examining the analysis with six clusters and then five, it was evident that the preference dimensions or values repeated in more than one group, leading to the decision to adopt four types of Brazilian consumers. Table 7 summarizes the results.

[Insert Table 7 about here]

After the initial cluster analysis, an MDA was undertaken to validate the consistency of the groups. MDA is used to reduce the differences between variables to classify them into a set number of broad groups. Wilks's lambda distribution confirmed the four-group proposition, as the results in Table 8 show. Figure 4 presents the distribution graphically.

[Insert Table 8 about here]

[Insert Figure 4 about here]

Finally, the study used cross tabulation to test the individual latent variables of personal values, consumer preferences, mindsets, and lifestyles to check the independence of variables regarding the proposed groups created through the MDA and cluster analysis. This test was conducted to check if the predicted model would be maintained. Tables 9 and 10 show the figures for the ANOVA and chi-squared tests, confirming the non-existence of unpredictable dependence between the model variables.

[Insert Tables 9 and 10 about here]

The results of the statistical tests reveal first that there are some groups within the sample. These groups were identified based on personal behavioral values, consumer preferences, consumer's mindsets and lifestyles. The different groups have different preferences and companies must attend to this fact in their marketing activities. For each of these aspects, it is necessary to contextualize the variables explored and the socio-demographic profile of the consumers. Thus, the next section draws on the analyses and contextualizes each of the groups identified, developing a typology.

Typology of Brazilian consumers

At this stage of the investigation, it is possible to highlight the four profiles extracted by empirical research concerning Brazilian consumers. Table 11 presents each of these profiles.

[Insert Table 11 about here]

To identify each type of Brazilian consumer, the names of important personages from Brazilian and Latin American history were adopted based on the work of Freyre (1985). Although the names do not have a direct historical link to the profiles identified in the empirical research, they were chosen to present characteristics very well known to Brazilian people and reinforced by Freyre (1985).

Quilombolas (focus on oneself)

The first profile identified in the research is an individual who values money (reasonable price, affordable, and fair) as the main dimension in product choice (66.4%). For this type of consumer, attributes such as aesthetics, durability, the offer of a warranty, and even the positioning within the line are secondary factors during the purchase decision process. The Quilombolas value money and are parsimonious when they go shopping.

The designation Quilombolas for this profile draws on those who resisted slavery when Brazil was colonized and sought freedom by escaping and reorganizing in urban centers called quilombos. Living in unfavorable economic conditions, they made use of creativity to survive at the margins of the system. In such a situation, it is natural to value money, making a fair price the first priority in the process of choosing products. In addition to seeking affordable products, another characteristic of this Brazilian consumer profile is the escape from the conventional and the search for one's own identity, a characteristic that refers to some extent to the origin of the name Quilombolas.

The main behavioral value observed in this group is a focus on the self. According Schwartz's (2006) values, they focus on self-direction (46.5%), which includes being free and independent, and having self-respect. Although other elements can be added, the overall profile will be curious and creative. Consumers of the Quilombolas type are fleeing from the traditional and they resist being imposed upon by the market, seeking their own identity and demonstrating this through their buying behavior, which ultimately results in the satisfaction of the sense of being free. Such behavior is reflected in the preferences that the Quilombolas exhibit by the activities they undertake in their free time. When given a choice, consumers matching this profile primarily prefer outdoor activities (33.6%), or evening activities (16.6%), such as shows, bars with live music, and parties. Thus, they exhibit interest in beaches, parks, sports, walking or horseback riding as the main ways of enjoying their free time.

Moreover, Quilombolas make their decisions largely influenced by emotional aspects (mean 6.02). Therefore, freedom and independence drive their decisions, which are—at least to a certain extent—not influenced by rational arguments. This finding provides valuable clues to the origin of the motivations that lead to the profile, i.e., the consumption of items that reinforce their sense of personality and that can be linked to them emotionally. Companies with an interest in this target segment should consider in their marketing and communications affordable products that express freedom, creativity, and a sense of personality. The sites for advertisements and marketing activities are likely to be places in which there are outdoor activities and nightly entertainment, as both are in alignment with the values declared by the Quilombolas.

Frontiersmen (focus on goal)

Just like the Quilombolas, the frontiersmen refer to an important group in the formation of the Brazilian people, made up of those who stepped into the unexplored interior territory of Brazil in search of precious metals, especially silver (Freyre, 1985). Like the explorers of times past, the frontiersmen category of consumers are also insightful in relation to their goals, to the point of having the principal value of achievement (30.9%); also included in this value dimension are intelligence, influence, success, and ambition. The achievement of success, so highly valued, also means that they value the outcome of their work. In relation to consumption, the main aspect determining the product purchase decision is fair price (57.6%). Ardent pursuers of their goals, frontiersmen are selective with respect to consumption and openly declare an interest in affordable products, even if they have favorable financial conditions for luxury consumption.

Just like the Quilombolas, frontiersmen are attracted primarily by outdoor activities in their spare time (29.1%), but are less festive and more focused on learning and intellectual pursuits that draw them closer to their goals. Moreover, frontiersmen differ from the Quilombolas with regard to their second leisure pursuit, i.e., cultural outings (16.5%), such as visits to theaters, libraries, museums, and bookstores. Also, unlike the Quilombolas, frontiersmen take into account primarily rational aspects (mean 5.65) in decision making.

These aspects emphasize the values of goal attainment and the up-front declaration of value for money, therefore indicating the need for strategic marketing that attains the attention of frontiersmen. To emphasize the sense of accomplishment in consumption, companies with an interest in frontiersmen as their target audience should focus on intellectual stimuli and success. As for the marketing mix, it should focus on the link between cost and benefit, keeping the prices affordable. Complementing this perspective, brands that are interested in approaching such customers, beyond planning communication related to outdoor activities, should focus on cultural programs, such as those mentioned above.

Thus, frontiersmen differ from Quilombolas in terms of their greater tendency to spend money (albeit slight), and instead of valuing their freedom and creativity, they primarily value the results of their work and the goals achieved. However, both differ from the third type, the crown prince, commented on in the next section.

The crown prince (seeker of personal satisfaction)

The figure of the crown prince in the formation of Brazil was brief but important. Although there have been two natural crown princes of Brazil, Dom Pedro II and Princess Elizabeth, the more relevant prince in national history was Portuguese, Dom Pedro I, who on arriving with his family on Brazilian soil decided not to return and proclaimed independence, then commenced the Brazilian Empire. Don Pedro I was crowned the first Emperor of Brazil in 1822 after decreeing independence from Portugal. Present in many historical events, such as the arrival of the royal family, I'll Stay Day, and the Independence Day of Brazil, Don Pedro I is also famous for the myth that has been created around his behavior, namely that he knew how to enjoy life like few others.

Thus, analogous to this historical character in national history, the third type of consumer identified in this study is characterized. Unlike the first two types, those with this profile are not restricted financially and do not seek their identity either by going against or being in favor of market trends. The main value of the crown prince as a consumer is hedonism (34.9%), exemplified by the pursuit of pleasure and enjoying life, and reflected in such consumers' behavior by seeking hedonic or experiential consumption, including products that bring some form of personal satisfaction. The main characteristic such a consumer takes into consideration when making the decision to purchase is related to the dimension of trust (72.6%), which affects aspects such as durability, warranty, safety, and reliability. This

highlights that the crown prince seeks quality products and notoriously does not raise issues relating to their use, such as requirements for exchange, the fulfilment of guarantees, or dissatisfaction in terms of time. As with other profiles, the crown prince also enjoys outdoor activities (17.5%). However, the second option for this type of consumer is electronic entertainment (15.2%), which includes television series, video games, and using computer-mediated social networking platforms.

The crown prince is a rational decision maker (average 5.49), and as such expects to have a certain level of subsidies during the purchase decision process. Companies wishing to attract the attention of the crown prince should emphasize their confidence in their product through rational arguments, and diversify their marketing activities between outdoor pursuits and wide-ranging media, such as television and social networking platforms.

The chaplain (benevolent)

Another important figure in the formation of the Brazilian people was the chaplain who, according to Freyre (1985), had a distinct role in society in the early centuries of Brazil's national history. A representative of the church, the chaplain was more than a notable figure and opinion maker, but rather someone close and accessible to local residents. He was a form of authority eventually invited to dinner at the home of ordinary people as if he were a friend or acquaintance without social distinction. The chaplain was still responsible for meeting the people's religious needs and promoting the education of the locals. Inspired by this person, the chaplain was adopted as the fourth consumer profile in this study as it is the only one of the profiles that does not have values focused on the self; rather, this person is benevolent by nature (52.8%). The chaplain's highest priority values are forgiveness, helpfulness, honesty, mature love, spiritual life, true friendship, and a greater meaning to life. Moreover, the chaplain projects his or her values so that others place priority on their values; thus, the chaplain exhibits altruistic behavior and dedication to the maintenance of affective social ties. Such consumers feel comfortable in visiting others' homes and making themselves part of a fraternal/sororial environment.

In terms of their purchasing behavior, for chaplains, trust (93.8%) is the main feature influencing the decision-making process. They have an aversion to low-quality products, as the lower price may not confer functionality over time. Moreover, the chaplain's decision making is based primarily on emotional aspects (mean 6.1), reflecting the importance of benevolence.

Like the other profiles, the chaplain also has a preference for outdoor activities (34.5%), but considers cultural outings (12.4%) another pleasant way to occupy free time. Both these options allow collective activities and strengthen the enaction of the value of benevolence. From a business perspective, this consumer segment will be predisposed to consume products that reinforce this sense of benevolence, either in helping others or in union with them and strengthening the bonds of friendship. Marketing activities should be directed toward leisure outdoor environments as well as cultural settings.

Conclusion and implications

The central objective of this study was to identify types of Brazilian consumers. Thus, the primary contribution of this paper is that shows how it is possible to generate group profiles, identifying ideal types based on international literature and the literature related specifically to the Brazilian national context, as well as empirical study. The multiscale instrument built for this research will also contribute to future studies in the Brazilian consumer context following validation for such applications.

The second major contribution is the proposal of the four profiles resulting from the survey. Future studies may apply these profiles in sampling or comparing groups of

consumers. The composition of the four variables makes each profile exclusive and considerably differentiates its members. Typologies are theoretical constructs that seek patterns supporting managerial decision making, and in this respect the current proposition is relevant as it has identified characteristics that provide an unprecedented combination of psychological aspects. Thus, this research will be of great value to practitioners of strategic marketing, who can use this classification to identify their target audience and plan their marketing efforts in a more targeted and effective way.

Tamayo and Schwartz (1993) investigated Brazilian people and confirmed the two local dimensions with a concentration in one extreme of Schwartz's (2006) original proposition, so there are four different groups: openness to change versus conservation and self-transcendence versus self-enhancement. Moreover, Schwartz's (2006) dimensions of benevolence, achievement, hedonism, and self-direction are of relevance, reflected in the chaplain, frontiersmen, crown prince, and Quilombolas profiles respectively, and thus reinforcing Tamayo and Schwartz's (1993) study (see Figure 5). The main difference between Tamayo and Schwartz (1993) and this study is the lack of a conservation dimension. This might be due to the difference in time between the studies, although there is no empirical evidence to support this notion.

[Insert Figure 5 about here]

Marketing managers wish to gain a better understanding of consumers, and the proposed model of group classification will aid them in this effort. According to the study findings, four variables are sufficient to understand and classify consumers' behavior. Figure 6 shows the proposed model of consumer classification.

[Insert Figure 6 about here]

This research investigated Brazilian consumers, but studies could replicate the methodology with any other culture. Although the results do not cover the population of the whole country as there was a high concentration in the sample of people from one state, it is nonetheless possible to propose that there are different kinds of Brazilian consumer and that they can be identified using the combination of the four variables measured by the scales employed in the survey instrument. However, in another environment and at another time, there may well be changes in the profiles because the values and interests of people are dynamic and change over their lifetime, as well as within the context which they are living.

The proposed model for consumer classification and the initial classification of Brazilian consumers comprise a contribution to the international literature. Future research might test the proposed model in an applied business context to observe its performance. Moreover, studies could expand the scope of data collection in terms of both sample size and time scale, and monitor if the profiles are the same for other populations, and whether they remain the same or change over the course of time. Other socio-cultural aspects could also be included in the questionnaire, as they could prove useful in providing a better contextualization of the profile.

The typologies are justified by similarities between the subjects in the same group and by differences from the subjects in other groups. Thus, it is important to highlight that while the Quilombolas are not especially attracted by electronic entertainment, and frontiersmen mix pleasure with intellectual stimuli to achieve their goals, the crown prince is primarily interested in the momentary satisfaction of a television program or a video game, and does not take into account whether the product is for the mass market or if it entails no intellectual learning. Nonetheless, there is something that these three consumer profiles have in common,

although with a different degree of emphasis: each reports prioritizing personal values, the importance of being at liberty to have a unique personality, and the achievement of personal goals or personal satisfaction. These are attributes not present in the fourth profile: the chaplain.

Finally, this paper suggests a new way of determining consumer profiles, in this case in the Brazilian context. The four groups exhibit different values and behaviors, and if these are not distinct, it might influence the performance of other investigations or practices.

Table XI.
Summary of types of Brazilian consumers

	Chaplain (benevolent)	Frontiersmen (focus on goal)	Crown Prince (personal satisfaction seeker)	Quilombolas (focus on oneself)
<i>Lifestyle/leisure preferences</i>	Outdoor activities and cultural outings	Outdoor activities and cultural outings	Outdoor activities and electronics	Outdoor activities and night live
<i>Most important feature when buying products</i>	Trust	Monetary value	Trust	Monetary value
<i>Personal behavioral values</i>	Benevolence	Achievement	Hedonism	Self-direction
<i>Type of decision</i>	Emotional	Rational	Rational	Emotional

Appendix

Table A1.
Measurement scales

Schwartz (2006)	Blankson and Kalafatis (2004)	Lucian <i>et al.</i> (2008)
1. Equal opportunity for all	1. Adjust to own wants	1. I have a good imagination
2. At peace with myself	2. Affordability	2. I believe my intuition leads to correct choices
3. Control over others, dominance	3. Attractive	3. I like to spend time interacting with other people
4. Gratification of desires	4. Better than competition	4. I am objective in my duties
5. Freedom of action and thought	5. Choice	5. I look at the situation as a whole and not into several smaller parts together
6. Emphasis on spiritual not material matters	6. Consider people as important	6. I like mathematics
7. Feeling that others care about me	7. Convenience to obtain	7. I appreciate the arts
8. Stability of society	8. Cool	8. I am moved by emotion
9. Stimulating experiences	9. Country of origin	9. I prefer to solve problems step by step
10. A purpose in life	10. Differentiation	10. I make decisions rationally
11. Courtesy, good manners	11. Dignity	11. I am creative
12. Material possessions, money	12. Discriminatory	12. I am a detail person
13. Protection of my nation from enemies	13. Durability	13. I prefer informal situations
14. Belief in one's own worth	14. Easy to operate/use	14. I logically analyze situations before deciding
15. Avoidance of indebtedness	15. Elegant	15. I don't care much about the time
16. Uniqueness, imagination	16. Expensive	16. I am a responsible person
17. Free of war and conflict	17. Extra features	17. I get irritated with things that draw my attention at work
18. Preservation of time-honored customs	18. Eye catching advertisements	18. Formal situations entertain me
19. Deep emotional and spiritual intimacy	19. Familiarity	
20. Self-restraint, resistance to temptation	20. Friendly service	
21. From worldly concerns	21. Good aesthetics	
22. Safety for loved ones	22. Good quality	
23. Respect, approval by others	23. High principles	
24. Fitting into nature	24. Impressive service	
25. Filled with challenge, novelty and change	25. Leaders in the market	
26. A mature understanding of life	26. Mass produced	
27. The right to lead or command	27. Middle class	
28. Close, supportive friends	28. Non-selective	
29. Beauty of nature and the arts	29. Own brand	
30. Correcting injustice, care for the weak	30. Patriotism	
31. Self-reliant, self-sufficient	31. Personal attention	
32. Avoiding extremes of feeling and action	32. Personal recommendation	
33. Faithful to my friends, group	33. Posh	
34. Hardworking, aspiring	34. Prestigious	
35. Tolerant of different ideas and beliefs	35. Reasonable price	
36. Modest, self-effacing	36. Reliability	
37. Seeking adventure, risk	37. Safety	
38. Preserving nature	38. Satisfaction from usage	
39. Having an impact on people and events	39. Social group	
40. Showing respect	40. Stable/long-standing provider	
41. Selecting own purposes	41. Standardized	
42. Not being sick physically or mentally	42. Status	
43. Being competent, effective and	43. Suitability	
	44. Superior	
	45. Name of product/service/brand	
	46. Top of the range	
	47. Trustworthy advertisements	
	48. Upper class	
	49. Value for money	
	50. Variety	
	51. Warranties	
	52. Well known	
	53. Wide range	
	54. Youth market	

-
- efficient
 - 44. Submitting to life's
circumstances
 - 45. Being genuine, sincere
 - 46. Protecting my "face"/image
 - 47. Being dutiful, meeting
obligations
 - 48. Being logical, thinking
 - 49. Working for the welfare of
others
 - 50. Enjoying food, sex and leisure
 - 51. Holding to religious faith and
belief

How Brazilians shop? An investigation of Brazilians' consumer values, lifestyles and mindset.

Table I.

Characteristics used in the study of lifestyle

Author(s)	Dimensions considered in models
Buskirk (1975)	Product features, price, advertising, distribution
Brown and Sims (1976)	Problem solving, Usage scenarios, Users, Competitors
Wind (1982)	Product features, benefits, troubleshooting, occasions of use, users, comparison with other products, product classification
Aaker and Shansby (1982)	Attributes, price/quality, use, user, product class, competitors
Ries and Trout (1986)	Market leader, followers, competition, brand, resellers
Kalafatis <i>et al.</i> (2000)	Price, ease of doing business, personal contact, product performance, variety of products, presence, security, leadership, distinct identity, status, national identity, differentiation, and attractiveness
Blankson and Kalafatis (2004)	Top of the line service, value for money, reliability, aesthetic attractiveness, country of origin, brand name, and selectivity

Source: Based on Blankson and Kalafatis (2004, p.10)

Table II.

Model of cognitive functions

	Emotional profile	Rational profile
Decision-making process	Fast, parallel, automatic, effortless, associative, slow learning	Slow, serial, controlled, laborious, regulated, flexible

Source: Based on Kahneman (2003)

Table III.

Descriptive statistics for rational/emotional responses

		Emotional thinking	Rational thinking
N	Valid	1508	1508
	Missing	0	0
